

Curtiss-Wright Product Announcement FAMOS Version 22 (V22) Release

January 31, 2019

Curtiss-Wright is excited to announce that January 31, 2019, was the release date of the new version of Scientech's FAMOS software. This release has incorporated many new features and enhancements, incorporating valued feedback from our client end users. The release has been designed to make our completely integrated performance and condition monitoring solution set even easier to use and includes time-saving tools that no FAMOS user should go without.

The V22 release includes an optional integrated tool for calculating Cycle Isolation losses, an IOS application to access FAMOS data, a new capability to integrate clients existing PEPSE models (PEPSE RT), an updated historian package (x64) and integrated support for wireless sensors. The cycle isolation function has been Beta tested with several customers who have deployed the capability across their generation fleets.

In addition, V22 builds on the solid FAMOS foundation and includes updates for graphics, calculations, data manipulation (sorting, filtering, and comparing), trending, navigation, and setup. Many of the tools have been optimized for rendering speed, for reduced CPU usage, and to provide quick access to data necessary for diagnostics.

To upgrade to the latest FAMOS version or to receive more information, contact Bob Holzworth or Josh Bartlett.
